

ABSTRACT

A method and device for transmitting data fragments with an indication that a fragment is a last fragment of a group. For example a source may transmit a last fragment in a group with an indication that it is a last fragment of such group. Upon receipt by a destination of a last fragment, the destination may transmit a group acknowledgment frame that may include data on the fragments of such group that were successfully received by such destination. A source may determine from the group acknowledgement frame whether any transmitted fragments of a group were not successfully received, and may retransmit fragments until all fragments in the group are successfully received by a destination.
